

ABSTRACT OF THE DISCLOSURE

An Internet access system includes a wireless
local area network having wireless access points and a
rental control station connected to the wireless local area
network, the rental control station including a network
5 access script generator for generating a network access
script, a network access database, and a data input unit,
and a wireless station adapter synchronizable to communicate
with the access point after having been automatically
installed and configured in a communication device by the
10 network access script.
